Beauxfort

• DISTINCTIVE LANDSCAPE SYSTEMS •

At Beauxfort quality is at the heart of everything we do from the products we sell to the experience of our customers. This is where the idea of GravelEdge was born.

Edging is an important component to a gravel driveway, it is used to create clean, crisp lines between the driveway and the surrounding lawns or plant beds. Aesthetics aside the primary purpose of using edging in this application is to secure the gravel in place. In the installation of a gravel driveway, a gap has to be left around the edges to account for material expansion in the warmer weather. Edging prevents gravel from slipping out the sides, as it acts as a barrier between the expansion gap and the area beside it.

Introducing GravelEdge

To further enhance our customer experience, we created GravelEdge as an add-on product to our most-loved product, Gravelrings. This means landscapers are able to buy all the structural components to a gravel driveway under a single roof with the confidence they are created from premium, quality materials manufactured in the UK.

Quality is Key

GravelEdge is underpinned by quality as it is formed of the most durable aluminium alloy, which is rust resistant. Sustainability is a factor Beauxfort is continually working on as such the aluminium used is sourced from 100% recyclable material. Yet, it is flexible enough to craft curved or straight lines by hand. The installation is dry fix which means no concrete is required, saving on time and money.
